Clinical Brain Mapping takes you step by step through the methods and functional bases of the techniques, focusing on all clinical situations that require cerebral localization for diagnosis and therapeutic management. Clinical Brain Mapping is cohesively organized into two sections: Techniques and Systems. The first section covers the full scope of methods for determining cerebral location, from the classic Wada test to the newest fMRI and magnetoencephalography procedures.

Brain mapping in epilepsy constitutes a robust fashion both to study complex cognitive skills, such as language and memory (and better understand their normal functioning), and to grasp the dynamic time course of epileptic seizures ' impact on neural plasticity. Strongly related to the clinical issue of pre-/postsurgical outcomes of patients suffering from drug-resistant syndromes, these techniques bring complementary data to map the cortical networks in individuals (cortical mapping and ...

Intraoperative brain mapping using an awake craniotomy is the gold-standard procedure for the identification and preservation of cortical and subcortical motor function during surgery for patients with intrinsic brain tumors. Careful consideration of the intraoperative approach takes into account anatomic considerations of the tumor with presurgical evaluation of the patient.

Brain mapping also looks from the outside in. It examines how our environment changes our brain's structure by studying, for instance, how the brain changes physically through the learning and aging processes. Brain mapping also examines what goes wrong physically in the brain during mental illnesses and other brain diseases.
