Tooth designation systems are routinely
used in dental practice, for identification of
teeth, recording dental data and
communication among dental professionals.

(PDF) Tooth Morphology Overview

Anterior teeth include the teeth toward the
front of the mouth, including the central
incisors, the lateral incisors, and the canines,
while posterior teeth, or the teeth toward the
back of the mouth, include the premolars
and molars . The difference between these
types of teeth will be described in the next
section.

Download PDF Dental Anatomy and Morphology - DENCYCLOPEDIA

This gives an excellent overview of its subject - I think many undergraduate students will find that course material on tooth morphology is still largely based on this. There are still other books out there that may supplement this e.g. by having full-colour pictures or more detailed diagrams of the teeth in question, or yet more information.

1.2)

The morphology of mandibular central and lateral incisors is not very dissimilar with the majority of teeth having two canals (25 – 40 %) [5, 23, 24]. The mandibular permanent canine tooth often has a single root (98 %) with a single canal and one apical foramen (92 %).

Anatomy and Root Canal Morphology

Dental anatomy is a field of anatomy dedicated to the study of human tooth structures. The development, appearance, and classification of teeth fall within its purview. Tooth formation begins before birth, and the teeth's eventual morphology is dictated during this time. Dental anatomy is also a taxonomical science: it is concerned with the naming of teeth and the structures of which they are made, this information serving a practical purpose in dental treatment. Usually, there are 20 primary te

The Central and lateral Incisors are the teeth designed to cut or shear our food while our cuspids also known as Canines are geared for grabbing and tearing food. The posterior teeth have a wider occlusal table and not as sharp cusps which are designed to crush and grind our food making food easier to digest.
