Disease management is defined as "a system of coordinated healthcare interventions and communications for populations with conditions in which patient self-care efforts are significant." For people who can access health care practitioners or peer support it is the process whereby persons with long-term conditions share knowledge, responsibility and care plans with healthcare practitioners and/or peers. To be effective it requires whole system implementation with community social support networks

Disease management (health) - Wikipedia

Disease management is described as a system of coordinated health care interventions in which patient education and self-care are key components. This book offers a practical systems approach to the subject of disease management.

Objective medical decision–making has shown itself to be an emerging discipline which is sufficiently robust to promote its further development. This book identifies many important areas for applications in the field of acute patient care. The different approaches require testing, evaluation and mutual co–parisons to ensure that the right method is used to solve the existing problem. Medical sciences and patient care are increasingly supported by system sciences, resulting in growing multi- and interdisciplinary research and development areas. In this context, system sciences involve the methods, techniques, concepts and approaches obtained f–om disciplines such as mathematics, statistics, stochastic signal theory, fuzzy set theory, systems and control theory, signal analysis, pattern recogni tion, simulation, computer languages, structured programming, data base management and computer sciences. This book contains the papers of a workshop "Objective Medical Decision making I Systems approach in acute disease" which was initia ted and supported by the SWG/COMAC on Biomedical Engineering, Evaluation of Technology, Transfer and Standardization of CRM/CREST of the European Community. In setting up the original programme we have been assisted by a group of experts and for their cooperation we are very gratef ul to S. Davids, Copenhagen E. Epple, Tübingen ; J. Jones, Harrow; L. Lambotte, Brussels C. Marchesi, Pisa and D. Robert, Lyon. The papers have been arranged in four groups, each followed by a brief synopsis. The four groups are : diagnosis, monitoring, therapy and control, and evaluation of criteria and procedures.

"Overall, the book walks a delicate balance between evidence and advocacy regarding the care of people with chronic conditions. Nolte and McKee conclude the volume with the following: "A first step is to recognize that something must be done. A second, which we hope will be facilitated by the evidence provided in this book, is to realize that something actually can be done, and that they can do it (p. 240)". The overarching desire to match the need for evidence with the reality that advocates (including policy-makers) need a reasoned voice makes the book well suited to health policy deliberations." International Journal of Integrated Care The complex nature of many chronic diseases, which affect people many different ways, requires a multifaceted response that will meet the needs of the individual patient. Yet while everyone agrees that the traditional relationship between an individual patient and a single doctor is inappropriate, there is much less agreement about what should replace it. Many countries are now experimenting with new approaches to delivering care in ways that do meet the complex needs of people with chronic disorders, redesigning delivery systems to coordinate activities across the continuum of care. Yet while integration and coordination have an intuitive appeal, policy makers have had little to help them decide how to move forward. The book systematically examines some of the key issues involved in the care of those with chronic diseases. It synthesises the evidence on what we know works (or does not) in different circumstances. From an international perspective, it addresses the prerequisites for effective policies and management of chronic disease. Taking a whole systems approach, the book: Describes the burden of chronic disease in Europe Explores the economic case for investing in chronic disease management Examines key challenges posed by the growing complexity in healthcare including prevention, the role of self-management, the healthcare workforce, and decision-support Examines systems for financing chronic care Analyses the prerequisites for effective policies for chronic care Caring for People with Chronic Conditions is key reading for health policy makers and health care professionals, as well as postgraduate students studying health policy, health services research, health economics, public policy and management. Contributors: Reinhard Busse, Elisabeth Chan, Anna Dixon, Carl-Ardy Dubois, Isabelle Durand-Zaleski, Daragh K Fahey, Nicholas Glasgow, Monique Hejmans, Izat Jiwani, Martyn Jones, C'é cile Knai, Nicholas Mays, Martin McKee, Ellen Nolte, Thomas E Novotny, Joceline Pomerleau, Mieke Rijken, Dhigna Rubiano, Debbie Singh, Marc Sutreke.

This publication explores some of the key issues, ranging from interpreting the evidence base to assessing the policy context for, and approaches to, chronic disease management across Europe. Drawing on 12 detailed country reports (available in a second, online volume), the study provides insights into the range of care models and the people involved in delivering these; payment mechanisms and service user access; and challenges faced by countries in the implementation and evaluation of these novel approaches.

Although much has been achieved in care coordination and accountable care, healthcare leaders need additional, game-changing innovations to deal with constraints in clinical resources, care capacity, and cost that have not yet been fully addressed. This need for innovation is especially great in the care of the chronically ill: the most costly, highest-risk segments of our populations. Filling this void, Developing a Poly-Chronic Care Network: An Engineered, Community-Wide Approach to Disease Management reconstructs and augments traditional chronic care delivery models. The proposed solution—the Poly-Chronic Care Network© (PCCN)—is a specific iteration of the Care Circle Network© (CCN) concept that creates a sustainable community-engaging response to the complexity, cost, and outcomes of chronic diseases. By dynamically engineering all the elements of a community 's "Capacity to Care" directly into short- and long-term patient care processes, the PCCN expands care capacity and physician "reach", and improves quality and outcomes, without increasing the total cost of care. The book describes the fundamental concepts, principles, and requirements for the PCCN and explains how this care model could augment and enhance other new business models, such as Accountable Care Organizations (ACOs) and Patient-Centered Medical Homes (PCMHs). In addition to a detailed description of implementation steps and organizational structures, the text provides useful insights into technologies that can aid and enhance implementation, including home/virtual monitoring, social networking, and dynamic simulation. Importantly, the book includes both detailed examples and a flexible how-to guide for setting up a PCCN or other CCN, offering readers step-by-step guidelines and options for combining readily-available communal resources with simple technologies in the design of innovative care models for their communities. With this book in hand, readers can confidently pick and choose specific components to match their community 's needs and capabilities, "amending the blend" to account for the size, scale, scope, and population of the community and patients they wish to serve.
