This volume offers students a basic introduction to assessing the meaning and validity of research in the social sciences and related fields. The ability to "read "published research critically is essential and is different from the skills involved in "undertaking "research using

statistical analysis. Thomas R Black explains in clear and straightforward terms how students can evaluate research, with particular emphasis on research involving some aspect of measurement. The coverage of fundamental concepts is comprehensive and supports topics including research design, data collection and data analysis by addressing the following major issues: Are the questions and hypotheses advanced appropriate and testable? Is the research design sufficient for the hypothesis? Are the data gathered valid, reliable and objective? Are the statistical techniques used to analyze the data appropriate and do they support the conclusions reached?

We often decide what to believe and what to question on the basis of a simple rule of thumb like believe the trustworthy source or trust the expert. Sometimes, however, reliable and well-informed sources support both sides of the controversy. Whom are we to trust? How can we make a decision on the issue at hand? The second edition of Evaluating Social Science Research provides methods for thinking critically about claims of factual knowledge and drawing appropriate conclusions.The authors have added new sections to the book to reflect the new developments in the field since the appearance of the first edition sixteen years ago. Included is an expanded discussion of observational method that addresses the issues of validity that are now more clearly understood. There is an explicit discussion of quasi-experimental research design, including an added distinction between equivalent-group and nonequivalent-group experiments. New explanations of the logic of multiple regression analysis, casual modeling, and meta-analysis have been provided as well.The new edition, while recognizing the limits of each research method, retains its emphasis on the importance of observations that may be repeated and checked by other researchers. It treats the reader as a key actor who can advance knowledge by cross-checking observations and interpretations.

This book provides methods for thinking critically about claims of factual kowledge and drawing conclusions. While recognising limits of research methods, emphasis is made on the importance of observations that may be repeated and checked by others.

This book examines very important issues in research evaluation in the Social Sciences and Humanities. It is based on recent experiences carried out in Italy (2011-2015) in the fields of research assessment, peer review, journal classification, and construction of indicators, and presents a systematic review of theoretical issues influencing the evaluation of Social Sciences and Humanities. Several chapters analyse original data made available through research assessment exercises. Other chapters are the result of dedicated and independent research carried out in 2014-2015 aimed at addressing some of the debated and open issues, for example in the evaluation of books, the use of Library Catalog Analysis or Google Scholar, the definition of research quality criteria on internationalization, as well as opening the way to innovative indicators. The book is therefore a timely and important contribution to the international debate.

Much applied research takes place as if complex social problems--and evaluations of interventions to address them--can be dealt with in a purely technical way. In contrast, this groundbreaking book offers an alternative approach that incorporates sustained, systematic reflection about researchers' values, what values research promotes, how decisions about what to value are made and by whom, and how judging the value of social interventions takes place. The authors offer practical and conceptual guidance to help researchers engage meaningfully with value conflicts and refine their capacity to engage in deliberative argumentation. Pedagogical features include a detailed evaluation case, "Bridge to Practice" exercises and annotated resources in most chapters, and an end-of-book glossary.

- This new edition gives students valuable practice in reading and

evaluating research. All major methods of research are illustrated, including qualitative research, content/document analysis, survey research, observational research, experimental research, and program evaluation. • The articles deal with contemporary topics that will hold your students' attention. • The lines in each article are sequentially numbered. This allows easy reference to specific parts of the articles during classroom discussions. • Factual Questions at the end of each article encourage students to read for methodological and substantive points. • The Answer Key provides answers to the Factual Questions. The line numbers where the answers can be found are included, making the key easy to use. • The Questions for Discussion at the end of each article address broad issues of research design and overall research quality. • Ideal for homework assignments followed by classroom discussions at the next class meeting.

Program Evaluation in Social Research presents a plan for developing evaluation into a form of applied social research that is methodologically sound, relevant to the problems of society, and built on a technological (as opposed to a scientific) model. Evaluation as applied, relevant social research and as social technology is described, along with its validity and usefulness. This book is comprised of eight chapters and opens with a discussion on the consequences of program evaluation for the conduct of social research and for society at large, and how evaluation can be made into a method of generating practical and powerful suggestions for planning successful social programs. The concept of "outcome evaluation" is also organized into meaningful categories which can be used for the intelligent planning of appropriate evaluation activities. The following chapters consider the types of evaluation that are carried out, the relative merits of each type, and how to optimize the validity and utility of each type. Evaluation as a technological, rather than a scientific, pursuit is also discussed. The remaining chapters focus on the frictions that arise during the implementation of program evaluation; program evaluation as a profession; and how evaluation can be developed into a relevant and

powerful method of guiding the course of social innovations. This monograph will appeal to sociologists, social scientists, and social researchers.

Bill Starbuck reflects on the challenges associated with social science research - the limits of rationality, the lack of reliability in many research findings and the social shaping of research agendas, cultures and judgements. He discusses some of his own research projects and various methodological debates.

Covering both quantitative and qualitative research, this new text teaches the skills for conducting research and how to read and evaluate published research. Real Research explains the systematic steps used by social scientists to examine the social world, and teaches te skills necessary to read, understand and realistically evaluate published research carried out by others. The author follows the stages of the research process and presents a model of "ideal" research; but she also emphasizes that research does not always involve an orderly set of steps, and is often affected by limitations such as time and money.
