The 32 bits of an IPv4 address are broken into 4 octets, or 8 bit fields (0-255 value in decimal notation). For networks of different size, the first one (for large networks) to three (for small networks) octets can be used to identify the network, while the rest of the octets can be used to identify

Let ' s now do some server tasks with sockets . Server Programming. OK now onto server things. Servers basically do the following : 1. Open a socket 2. Bind to a address(and port). 3. Listen for incoming connections. 4.

Bookmark File PDF

Introduction To Sockets

Accept connections 5. Read/Send.

Bind a socket. `socket_bind` can be used to bind a socket to a particular address and port. It needs a `sockaddr_in` structure similar to `connect` function.
