Once you have  $z$ , you can add  $-B/2$  and that gives two values with the desired sum  $-B$  and product  $C$ . Thus  $-B/2 \pm z$  will be the two roots to the original equation. This is an interesting way to solve quadratic equations. The method may be useful for students who have trouble memorizing the standard quadratic formula.

The new method uses the prior knowledge that the sum of the roots gives the coefficient of  $x$ , i.e.  $p + q = -b/a$  ( $p$  and  $q$  being the roots of the equation) This means the average of the sum of the roots is  $-b/2a$ , i.e.  $\text{avg}(p,q) = -b/2a$ . The new method basically states that the roots are equidistant from their arithmetic mean on the number line

Then the solution of the quadratic equation can be written out right away: (1) Summarize the old method and the new method for solving a quadratic equation: For example, solve equation:  $6x^2 + 5x + 1 = 0$ . We have:  $n_1 \cdot n_2 = a \cdot c = 6$  and  $n_1 + n_2 = b = 5$ . We can guess  $n_1 = 2$  &  $n_2 = 3$ . When we know  $n_1 = 2$  &  $n_2 = 3$ , the problem can be considered as "done". By applying Formula (1), we have:  $x = -2/6 = -1/3$  and  $x = -3/6 = -1/2$ .
