Nurses Computers And Information Technology

Nurses have the role of establishing a relationship with their patients and their families; they are responsible for explaining medications, taking vitals and helping patients with daily needs. In some hospitals, nurses are required to wheel in their workstation (a computer on wheels) to record information about the patient. While typing information on a computer is perceived to be more trustworthy by patients and healthcare professionals alike, it will inevitably create less face-to-face ...

How Technology is Impacting Nursing Practice in 2020

By Lauren Elrick on 09/26/2017. As technology advances, so does its influence in healthcare. Nurses must now be tech savvy to navigate online charting systems, update health records, schedule care and more. In days past, patient information was kept in carefully filed, handwritten charts.

nurses computers and information technology

Nursing computer based software allows nurses to collect, store, recover data and integrate clinical data with nursing management resources. Among multiple healthcare organizations, nurses represent the largest technology user group.

The Right Balance –Technology and Patient Care

The constant influx of new technology can make the ever-changing healthcare environment overwhelming. A masters-prepared nurse has the advantage of advanced education with expanded coursework in critical thinking, computer skills, and communication skills. With an online MSN, nurses can obtain their MSN while maintaining their work-life balance.

A compilation of both landmark historic and contemporary papers, illustrating the inception and evolution of nursing informatics. The authors have assembled the papers into an invaluable source book providing a framework for future developments in the field. Examining the relationship between nursing and information systems, practical applications include administration, practice, research, education, critical care, and community health. An essential tool for nurses seeking to attain credentials as Nursing Informatics Specialists.

Nursing, like other health-related professions, is information-intensive. The quality of care a patient receives is based on the soundness of judgment exercised by the health care team. Underlying sound judgment is up-to-date information. Unless nurses have access to accurate and pertinent information, the care being rendered will not be of the highest standard. What is required is not necessarily more rapid and efficient information services. Modern technology can process immense amounts of data in the blink of an eye. What we in the health professions need are information systems that are more intelligent, systems that can integrate information from many sources, systems that analyze and synthesize information and display it so that it may be applied directly in patient care—in other words, information that answers a question or even gives practical advice. In order to accomplish such objectives, work is needed to establish the scientific and theoretical basis for the use of computing and information systems by health professionals. This is the research component. In addition, there is the need for continued development and evaluation of practical information systems.

As the 21st century begins, we are faced with opportunities and challenges of available technology as well as pressured to create strategic and tactical plans for future technology. Worldwide, IT professionals are sharing and trading concepts and ideas for effective IT management, and this cooperation is what leads to solid IT management practices. This volume is a collection of papers that present IT management perspectives from professionals around the world. The papers seek to offer new ideas, refine old ones, and pose interesting scenarios to help the reader develop company-sensitive management strategies.

The rapid growth of home health care has raised many unsolved issues and will have consequences that are far too broad for any one group to analyze in their entirety. Yet a major influence on the safety, quality, and effectiveness of home health care will be the set of issues encompassed by the field of human factors research—the discipline of applying what is known about human capabilities and limitations to the design of products, processes, systems, and work environments. To address these challenges, the National Research Council began a multidisciplinary study to examine a diverse range of behavioral and human factors issues resulting from the increasing migration of medical devices, technologies, and care practices into the home. Its goal is to lay the groundwork for a thorough integration of human factors research with the design and implementation of home health care devices, technologies, and practices. On October 1 and 2, 2009, a group of human factors and other experts met to consider a diverse range of behavioral and human factors issues associated with the increasing migration of medical devices, technologies, and care practices into the home. This book is a summary of that workshop, representing the culmination of the first phase of the study.

The only text in the market written specifically for Diploma of Nursing students in Australia and New Zealand.
