According to Colman (1988), Harold Pinter ' s play The Caretaker illustrates the inadequacy of the stable set, a solution concept of cooperative game theory proposed by von Neumann and Morgenstern (1944). We challenge this illustration by pointing out that it is at variance with Pinter scholars ' interpretation of the play.

The complement of a finite set in R is open. If A is the union of the infinite sequence $x_n = 1/n$, $n = 1, 2, \dots$, together with its limit 0 then the complement $R - A$ is open. Any union of open intervals is an open set. The preceding examples are special cases of this. The converse statement is also true: every open set O is a union
