Explores real option theory applied in practice Real options are quickly becoming the valuation and decision-making method of choice for many companies, including oil and gas companies, utilities and natural resource companies, pharmaceutical and biotech companies, Internet companies, and many others. Real Options in Practice allows readers to view the world of real options from the vantage point of a corporate practitioner applying real option valuation techniques on a regular basis. Expert Marion Brach describes the challenges of implementing a real option framework in practice within a corporate setting. Touching on the real options most firms care about, Real Options in Practice identifies the classic types of real options--deferral, abandonment, switching, expansion, and compound--and explores the main concepts critical to understanding real option theory. Through Brach's own three-step real option valuation method readers will learn how the theory of real options is now being applied to drive better, more profitable corporate decision-making. Marion A. Brach, MD, MBA (Hagen, Germany), has undertaken financial valuation of business opportunities and acquisitions using scenario and real option valuation in the biotech industry. A recognized expert on real option theory and practice, Brach received her MBA from the Manchester Business School and frequently speaks at real option seminars.

The recent financial crisis has thrown many of the mergers and acquisitions of recent years into sharp focus. Too many have failed to generate real value for shareholders and many others have only proved lukewarm successes. Although it is impossible to assess accurately the extent to which these failures may be the result of poor planning and execution, they have raised considerable questions about the process, breadth and effectiveness of traditional due diligence activities. Value in Due Diligence explores new applications for due diligence including areas such as corporate culture, social responsibility, and innovation. It also examines the due diligence process itself to draw out those elements that provide effective risk and opportunity management as opposed to simple compliance.

Inhaltsangabe:Introduction: Over the last two decades, real options analysis (ROA) has become a fundamental part of project evaluation. Its increasing use in academia and corporations as well as its application to a wide range of industries make it a valuable tool in finance and accounting departments around the world. Classical capital budgeting approaches like net present value (NPV) techniques do not account for additional flexibility and are therefore a very static measurement. In addition to this, a further core factor is the strategic aspect of the investment decision. Companies often make decisions according to strategic reasons. This raises the question of how the bargaining power is divided between a seller and a buyer. Furthermore, the influence of the hold-up problem on the two involved players is analyzed. Finally, the trade surplus of the investment is divided between the seller on the one hand and the buyer on the other hand using a game theoretic approach to model this relationship. The airline industry is examined in this paper as it offers many possibilities to apply and explain the concepts of real options and bargaining in bilateral negotiations. This paper sets out to analyze the value of flexibility of an investment decision and discusses, in a second step, how the strategic power between the two parties involved is allocated. In academic literature, limited research has been done to find out about the combination of a real options analysis and the distribution of the trade surplus between the different players involved. This presents the following questions: Does an option in terms of the purchase of an aircraft have additional value in comparison to a classical and inflexible buy now decision for an airline? If this is the case, how much is this value worth and how is the trade surplus distributed between the two parties involved? Are there any hold-up problems? The following chapters will examine and answer these issues. Chapter two deals with a literature review on standard real options analysis in general and the airline sector in particular. In chapter three, background information about the airline industry is given and it is stressed why this sector is used for the capital budgeting approach. Chapter four covers the methodology that is used in chapter five. In this chapter, a case study involving the purchase decision of an aircraft is discussed using different methods to analyze the commit-now and purchase [...]
