In what follows, a Cartesian coordinate system is used to describe tensors. 1.9.1 Cartesian Tensors. A second order tensor and the vector it operates on can be described in terms of Cartesian components. For example, $(a \ b)c$, with $a = 2e_1 \ e_2 \ e_3$, $b = e_1 \ 2e_2 \ e_3$ and $c = e_1 \ e_2 \ e_3$, is. $(a \ b)c = a(b \ c) = 4e_1 \ 2e_2 \ 2e_3$.

2 Vector operations and vector identities. With the Levi-Civita symbol one may express the vector cross product in cartesian tensor notation as: $A \times B \leftrightarrow \epsilon_{ijk} A_j B_k$. (10) This form for cross product, along with the relationship of eq.(9), allows one to form vector identities for repeated dot and cross products.

In cartesian coordinates a vector V is expressed in terms of its components by $V = V_1\hat{x}^1 + V_2\hat{x}^2 + V_3\hat{x}^3$ (1.1) where \hat{x}^i is the unit vector in the direction of the i -axis. An alternative way of writing equation (1.1) is $V = (V_1, V_2, V_3)$, and sometimes just the symbol V_i . Then $V_1 = V \cdot \hat{x}^1$ and in general $V_i = V \cdot \hat{x}^i$.
