Visual-inertial navigation systems are credited with superiority over both pure visual approaches and filtering ones. In spite of the high precision many state-of-the-art schemes have attained, yaw remains unobservable in those systems all the same.

One canonical way of fusing IMU measurements in aided inertial navigation is to use an extended Kalman filter (EKF) (see, e.g., Mourikis and Roumeliotis, 2007). In this method, the inertial measurements are used to predict to the next time instance, whereas measurements from exteroceptive sensors are
